FRESH BITES CATERING

Thinks

- It has a great UI, application is easy to use, lightweight and fast
- Their customization is great, you can edit purchase/invoice/bill templates, add new custom data, and other things.
- It offers features for every process you'll need inside an organization, plus multiple features to add custom things so you can adapt Zoho Books to your internal workflow.
- Their support is not good, sometimes they only reply with documentation pages and most of them don't know how to do advanced things.
- Their API is great but when you want to do advanced stuff there's no way to do some things.

- The projects feature is what we use a lot it helps setting up projects as well as tracking expenses and bills for the whole project. The budgeting feature is very developed, allowing you to budget by total project cost, total project hours, hours per task, or hours per staff.
- Customer Estimates and Invoices are very easy to setup and send directly from the app (it also has a very nice and customizable reminder option).
- Stock and pricing listings is very intuitive and easy and makes it a very helpful and time saving feature.
- Bank reconciliation and Financial reporting are very developed and make it easy to share information with bookkeepers and accounting specialists.

- Tracking project timesheets
- Allowing clients to view past and current invoices
- Review our financial performance through the use of dashboards & reports
- Complexity of reporting can make it difficult to find the report you need
- Entering mileage can be a bit complicated
- Attaching receipts to keep track of expenses would be easier if it could connect to our bank account more readily
